

The Jabberwocky by Lewis Carroll

The Jabberwocky

The Jabberwocky is a ferocious beast, it is stealing food and crops from the villages. It is dangerous to humans, they are found in forest and jungles in Turkey.

Habitat
Jabberwocky habitat is a forest where they have plenty of food. It lives in a eerie, gloomy cave where no predators can locate where they live.

Appearance
Depending on where they live, the patterns and colors of their skin vary enormously. They have long razor sharp fangs to hunt for prey, pointy enormous tail, red rose eyes and strong appendages to run fast. They live up to 10-25 years and they continue to grow.

Diet
Despite being a powerful nocturnal creature, (although Jabberwockys are omnivores who hunt at night. When they grow they eat foods such as: insects, wheat and wolves. After eating a large meal they do not eat for a week. To conclude, the Jabberwockys are deadly creatures but they are also endangered and they will soon be extinct.

Hunting
Surprisingly, Jabberwocky are quick 49 miles per hour which means they are effective hunters. The Jabberwocky is sly and when it finds the right moment it would pounce out and tear their prey apart with their razor sharp fangs.

Reproduction
Unlike other animals it is hard for Jabberwockys to find a mate but when they find a mate they attract them with a loud screech. The females lay eggs after 1 week but it takes 5 months to hatch the baby is independent immediately.

We read the Jabberwocky by Lewis Carroll and enjoyed it so much that it inspired us to write a report on this fantastic beast.

We read reports on other animals to learn about structure, language features and the formal and technical vocabulary we might need and then we produced our own. We think they would look great in any non-fiction book!

THE JABBERWOCKY

There are many species of Jabberwocky and they are not endangered. They live in Jabberwocky and Jabberwock.

Appearance
Depending on their habitat, their body's appearance can vary. The Colour makes Jabberwocky is overall red and black and mostly black. They have one eye and a snake-like tongue. Their teeth are sharp that they can use to bite the bark of trees. However, the Jabberwocky has a long tail and might use these to climb trees and also has a human large and small fangs.

Habitat
Jabberwocky can be found in both forests and wood regions in Jabberwocky and Jabberwock. Due to where these beasts live they have amazing sight and hearing. They hide in trees and bushes so they can look from predators. Due to their habitat they have night vision and can move around their forests.

Diet
Although the Jabberwocky lives alone they find hunting very easy. They can not smell or pounce, so they must be very cautious. The Jabberwocky is a night-hunter and catch their prey with their fangs. They throw their tongue up in the air and catch Mothwing. Their digestive systems burn the prey but it up into a glowing ball. They have to eat almost every night. How their diet changes from insects and fruit to trees and people.

Breeding
Although the Jabberwocky can not live with others, they find making very easy by glowing colours. They are green and red. The female is and 16 days by the parent.

Defence
Jabberwocky are rather fighting. They are very strong and they can be up to 10ft. It has the eyes to see in the dark, it weighs up to two hundred pounds. They have heavy bodies, 10cm fangs, a long sticky tongue to grab its prey and webbed feet to swim through the swamp. Its appearance is rather fighting but only uses these when it hunts.

THE JABBERWOCKY

Currently, Jabberwockys can be found in cold areas and in shade away from the sun. However, these species are rapidly becoming extinct.

Appearance
These species are rather fighting. They are very strong and they can be up to 10ft. It has the eyes to see in the dark, it weighs up to two hundred pounds. They have heavy bodies, 10cm fangs, a long sticky tongue to grab its prey and webbed feet to swim through the swamp. Its appearance is rather fighting but only uses these when it hunts.

Habitat
Jabberwockys can be found in dark and shady places. We could find them in dark caves. It would be black mossy and damp. The Jabberwocky lives in this habitat because their thick fur can help them survive. They are nocturnal animals so they must hunt at night because of their clear eyes, but also be very camouflaged.

Diet
The Jabberwocky are omnivores. They only eat three things. They mainly eat children but they can eat Earth worms and leaves. After they eat a meal they don't eat for up to two days and then they hunt for more food.

Hunting
Despite their appearance, they are actually very slow. They hunt at night and they will not sleep until they have finished hunting. They use their tongue to grab the prey and suck the blood with their fangs. Then they use their venomous spit to kill the prey for good. After that they will take it home and eat their flesh.

Breeding
The males change their fur colour to attract the female. The female carries the offspring and then born after 3 months. Right after they are born and get abandoned for the rest of their lives.

Unfortunately these strange animals are becoming extinct along with other animals because of people going to the woods and killing them.
